

FM 753 evo

Doorsteekanker optie 7

*Doorsteekankers FM 753 zijn
uitzettingsbevestigingen voor betonnen
ondergronden.*

Kenmerken

Materiaal

- Elektrolytisch verzinkt staal.

Voordelen

- Kleine rand- en hartafstanden,
- Snelle en eenvoudige plaatsing: voorgemonteerde moer en sluitring en gereduceerde verankeringsdiepte;
- Ø van de schroefdraad = Ø van het boorgat,
- Schroefdraad beschermd tijdens de plaatsing: versterkte inslagpunt.
- Markering op de kop: identificatie van de afmetingen van het doorsteekanker na de plaatsing

Toepassingen

Applications

- Railings
- Metal and wood carpentry
- Facades

Toepassingsgebieden

- Ongescheurd beton,
- Harde natuursteen

1. The design loads loads have been calculated using the partial safety factors for resistances stated in ETA-approval(s). The loading figures are valid for unreinforced concrete and reinforced concrete with a rebar spacing $s \geq 15$ cm (any diameter) or with a rebar spacing $s \geq 10$ cm, if the rebar diameter is 10mm or smaller. 2. The figures for shear are based on a single anchor without influence of concrete edges. For anchorages close to edges ($c \leq \max [10 \text{ hef}; 60d]$) the concrete edge failure shall be checked per ETAG 001, Annex C, design method A. 3. Concrete is considered non-cracked when the tensile stress within the concrete is $\sigma_L + \sigma_R \leq 0$. In the absence of detailed verification $\sigma_R = 3 \text{ N/mm}^2$ can be assumed (σ_L equals the tensile stress within the concrete induced by external loads, anchors loads included).

1. The recommended loads have been calculated using the partial safety factors for resistances stated in ETA-approval(s) and with a partial safety factor for actions of $\gamma_F=1.4$. The loading figures are valid for unreinforced concrete and reinforced concrete with a rebar spacing $s \geq 15$ cm (any diameter) or with a rebar spacing $s \geq 10$ cm, if the rebar diameter is 10 mm or smaller. 2. The figures for shear are based on a single anchor without influence of concrete edges. For anchorages close to edges ($c \leq \max [10 \text{ hef}; 60d]$) the concrete edge failure shall be checked per ETAG 001, Annex C, design method A. 3. Concrete is considered non-cracked when the tensile stress within the concrete is $\sigma_L + \sigma_R \leq 0$. In the absence of detailed verification $\sigma_R = 3 \text{ N/mm}^2$ can be assumed (σ_L equals the tensile stress within the concrete induced by external loads, anchors loads included).
